Class 09: Structural Bioinformatics 1

Patrick Tran

What is in the PDB anyway?

The main database of biomolecular structures is called the PDB and is avaliable at www.rcsb.org

Let's begin by seeing what is in this database.

```
pdbstats <- read.csv("PDB.csv", row.names=1)
head(pdbstats)
```

	X.ray	EM	NMR	Multiple.methods	Neutron	Other
Protein (only)	152,809	9,421	12,117	191	72	32
Protein/Oligosaccharide	9,008	1,654	32	7	1	0
Protein/NA	8,061	2,944	281	6	0	0
Nucleic acid (only)	2,602	77	1,433	12	2	1
Other	163	9	31	0	0	0
Oligosaccharide (only)	11	0	6	1	0	4

	Total
Protein (only)	174,642
Protein/Oligosaccharide	10,702
Protein/NA	11,292
Nucleic acid (only)	4,127
Other	203
Oligosaccharide (only)	22

> Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

```
#Deal with the comma making making these non numeric...
n.xray <- sum(as.numeric(gsub(",","",pdbstats$X.ray)))
n.em<- sum(as.numeric(gsub(",","",pdbstats$EM)))
n.total <- sum(as.numeric(gsub(",","",pdbstats$Total)))
```

```
p.xray <- (n.xray/n.total)*100
p.em <- (n.em/n.total)*100

# and to 2 s.f
round(p.xray, 2)
```

```
[1] 85.9
```

```
round(p.em, 2)
```

```
[1] 7.02
```

There are 1.72654×10^5 protein structures (85.9%) and 1.4105×10^4 (7.02%) EM structures in the current PDB database.

> Q2: What proportion of structures in the PDB are protein?

```
as.numeric(gsub(",","",pdbstats$Total))/n.total
```

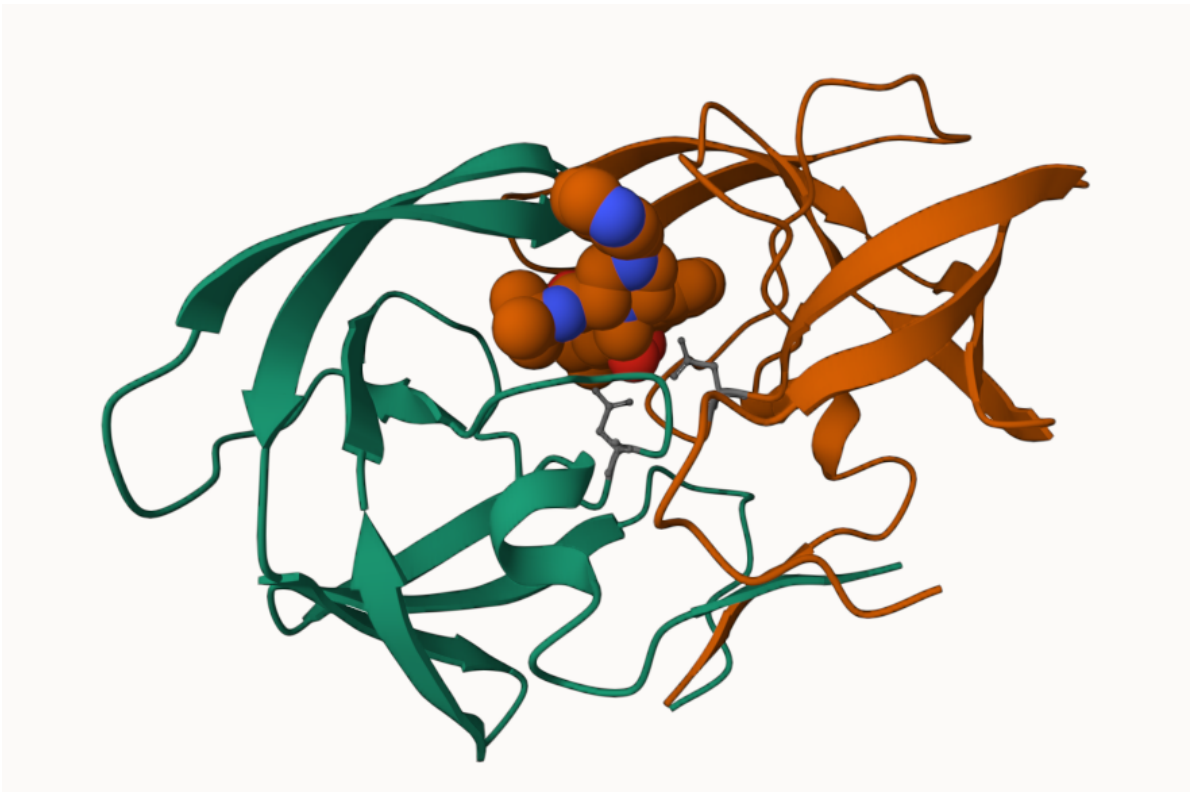
```
[1] 0.8689175473 0.0532469600 0.0561824587 0.0205335642 0.0010100105
[6] 0.0001094593
```

> Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

It is not straightforward to find all HIV-1 protease structures using plain text searching on the database.

A wee pic of HIV-1 Protease from Molstar

```
knitr::include_graphics("1HSG (2).png")
```



```
# or use `![An image I like whilst learning how to break Molstar](1HSG (2).png)`
```

> Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

We are currently looking at a resolution of 2.00 Å. We only see the oxygen atom. The 2 hydrogen atoms are too small to see.

> Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have?

HOH 307

Working with structure data in R

We will use the `bio3d` package for this:

```
library(bio3d)
pdb <- read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")

   Total Models#: 1
     Total Atoms#: 1686,  XYZs#: 5058  Chains#: 2  (values: A B)

     Protein Atoms#: 1514  (residues/Calpha atoms#: 198)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 172  (residues: 128)
     Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]

```

What is the first residue 3 letter code?

```
pdb$atom$resid[1]
```

```
[1] "PRO"
```

```
aa321(pdb$atom$resid[1])
```

```
[1] "P"
```

Q7. How many amino acid residues are there in this pdb object?

198

Q8. Name one of the two non-protein residues?

HOH

Q9. How many protein chains are in this structure?

2

Predicting functional motions of a single structure

Let's read a new PDB structure of Adenylate Kinase (PDB code: 6s36) and perform Normal mode analysis.

```
adk <- read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
```

```
adk
```

```
 Call:  read.pdb(file = "6s36")

   Total Models#: 1
     Total Atoms#: 1898,  XYZs#: 5694  Chains#: 1  (values: A)
```

```
     Protein Atoms#: 1654  (residues/Calpha atoms#: 214)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 244  (residues: 244)
     Non-protein/nucleic resid values: [ CL (3), HOH (238), MG (2), NA (1) ]

   Protein sequence:
      MRIILLGAPGAGKGTQAQFIMEKYGIPQISTGDMLRAAVKSGSELGKQAKDIMDAGKLVT
      DELVIALVKERIAQEDCRNGFLLDGFPRTIPQADAMKEAGINVDYVLEFDVPDELIVDKI
      VGRRVHAPSGRVYHVKFNPPKVEGKDDVTGEELTTRKDDQEETVRKRLVEYHQMTAPLIG
      YYSKEAEAGNTKYAKVDGTKPVAEVRADLEKILG

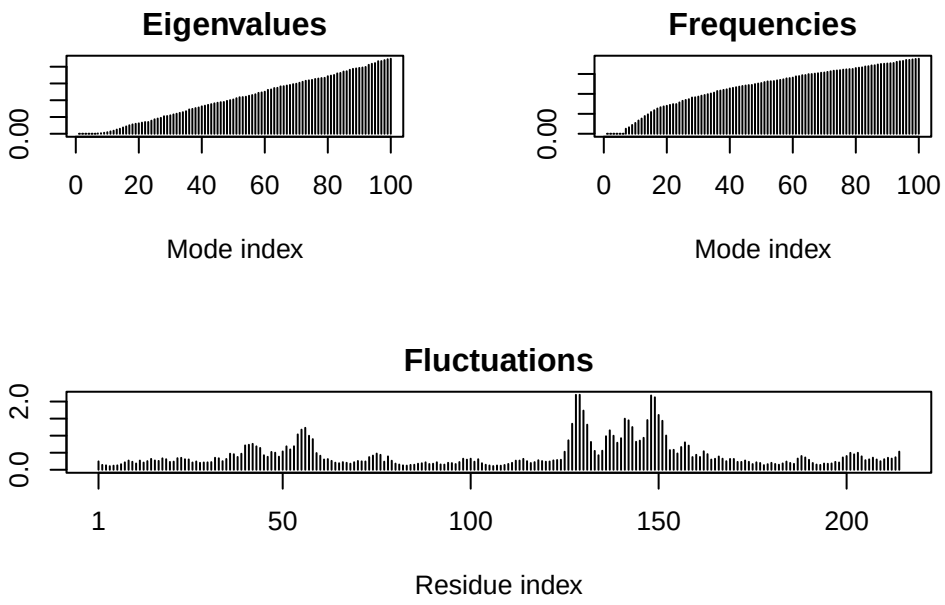
+ attr: atom, xyz, seqres, helix, sheet,
        calpha, remark, call
```

Normal mode analysis (NMA) is a structural bioinformatics method to predict protein flexibility and potential functional motions (a.k.a. conformational changes).

```
modes <- nma(adk)
```

```
 Building Hessian...        Done in 0.05 seconds.
 Diagonalizing Hessian...   Done in 0.25 seconds.
```

```
plot(modes)
```



```
mktrj(modes, file="adk_m7.pdb")
```

Section 4. Comparative Structure Analysis

Today we are continuing where we left off last day building towards compelting the loop from biomolecular strucutral data to our new analysis mehtods like PCA and clustering.

We begin with getting a single protein sequence for a protein family of interest.

```
library(bio3d)

aa <- get.seq("1ake_A")
```

```
Warning in get.seq("1ake_A"): Removing existing file: seqs.fasta
```

```
Fetching... Please wait. Done.
```

```
aa
```

```
             1        .         .         .         .         .         60
pdb|1AKE|A   MRIILLGAPGAGKGTQAQFIMEKYGIPQISTGDMLRAAVKSGSELGKQAKDIMDAGKLVT
             1        .         .         .         .         .         60

            61        .         .         .         .         .         120
pdb|1AKE|A   DELVIALVKERIAQEDCRNGFLLDGFPRTIPQADAMKEAGINVDYVLEFDVPDELIVDRI
            61        .         .         .         .         .         120

           121        .         .         .         .         .         180
pdb|1AKE|A   VGRRVHAPSGRVYHVKFNPPKVEGKDDVTGEELTTRKDDQEETVRKRLVEYHQMTAPLIG
           121        .         .         .         .         .         180

           181        .         .         .   214
pdb|1AKE|A   YYSKEAEAGNTKYAKVDGTKPVAEVRADLEKILG
           181        .         .         .   214

Call:
  read.fasta(file = outfile)

Class:
  fasta

Alignment dimensions:
  1 sequence rows; 214 position columns (214 non-gap, 0 gap)

+ attr: id, ali, call
```

Q10. Which of the packages above is only found on BioConductor and not CRAN?

msa

Q13. How many amino acids are in this sequence, i.e. how long is this sequence?

214

Now we can use this sequence as a query to BLAST search the pDB to find similar sequence and structures.

```
# Blast or hmmer search
#b <- blast.pdb(aa)
```

I could save and load my blast results next time so I don't need to run the search every time.

```
#saveRDS(b, file="blast_results.RDS")
```

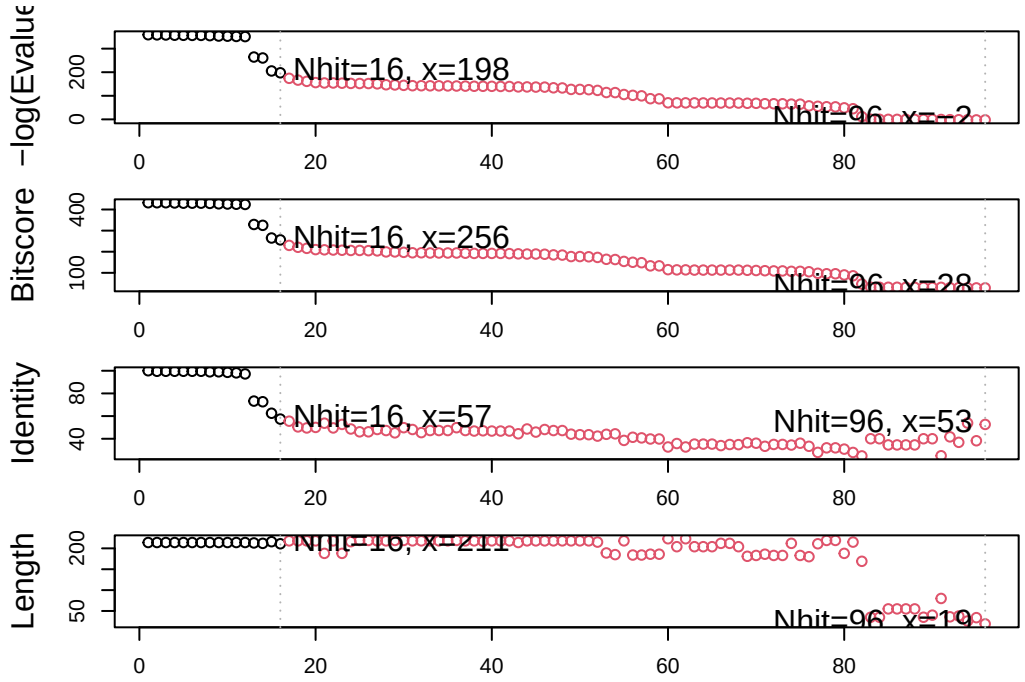
```
b <- readRDS("blast_results.RDS")
```

A summary plot of our BLAST results

```
hits <- plot(b)
```

```
* Possible cutoff values:    197 -3
          Yielding Nhits:    16 96

* Chosen cutoff value of:    197
          Yielding Nhits:    16
```



```

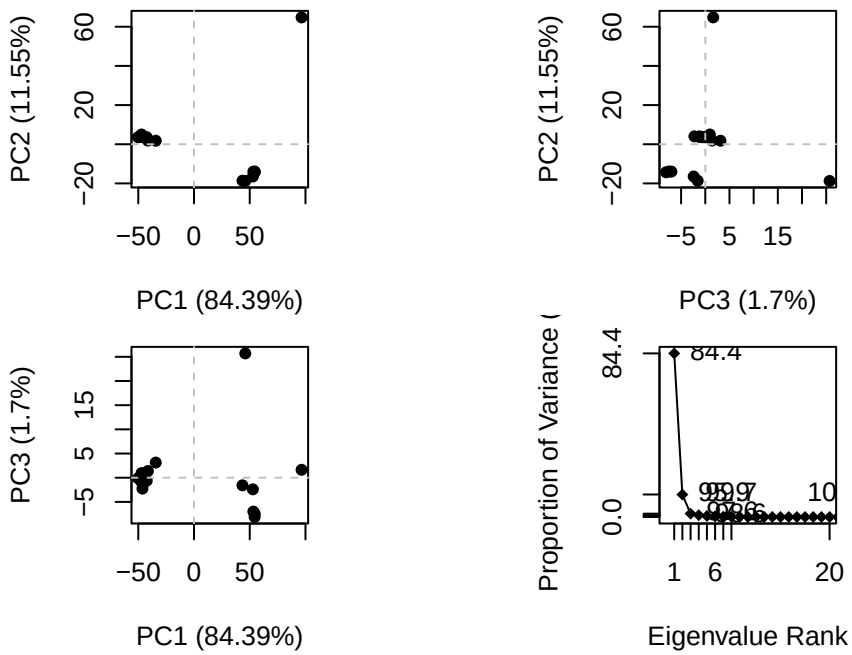
Principal Component Analysis

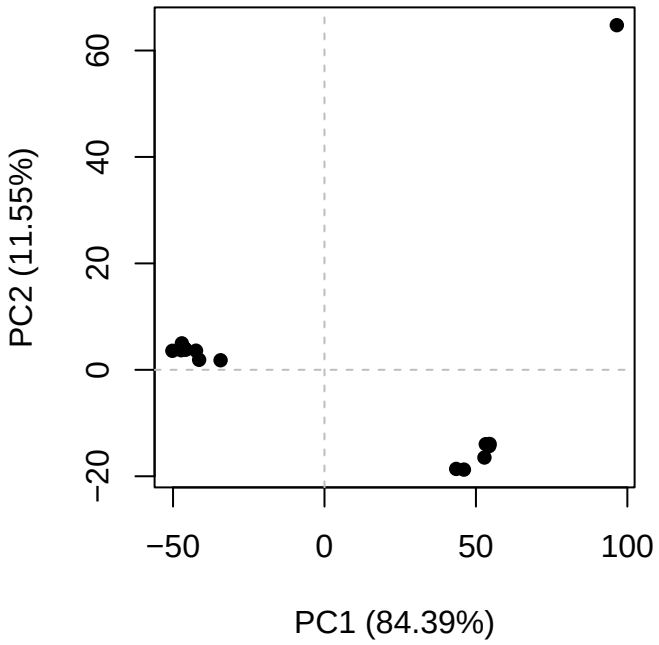
Time for PCA. We will use not the `prcomp()` function from base R but the `pca()` function from the `bio3d` package as this one is designed to work nicely with biomolecular data.

```
pc.xray <- pca(pdbs)
plot(pc.xray)
```



We can now focus in on PC1 vs PC2

```
plot(pc.xray, 1:2)
```



Lets cluster our structures

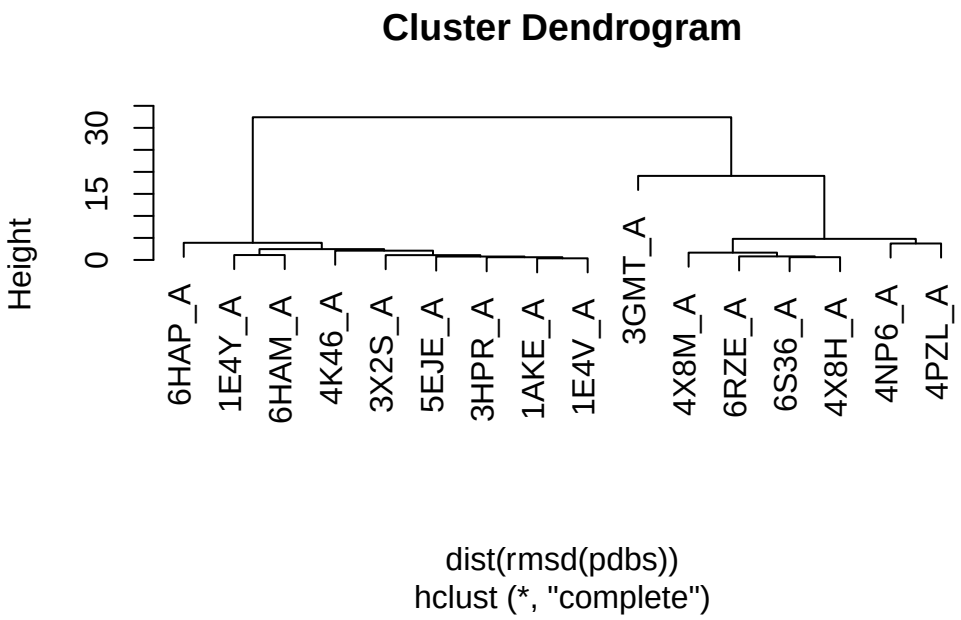
```
rd <- rmsd(pdbs)
```

```
Warning in rmsd(pdbs): No indices provided, using the 204 non NA positions
```

```
# Structure-based clustering
hc.rd <- hclust(dist(rmsd(pdbs)))
```

```
Warning in rmsd(pdbs): No indices provided, using the 204 non NA positions
```

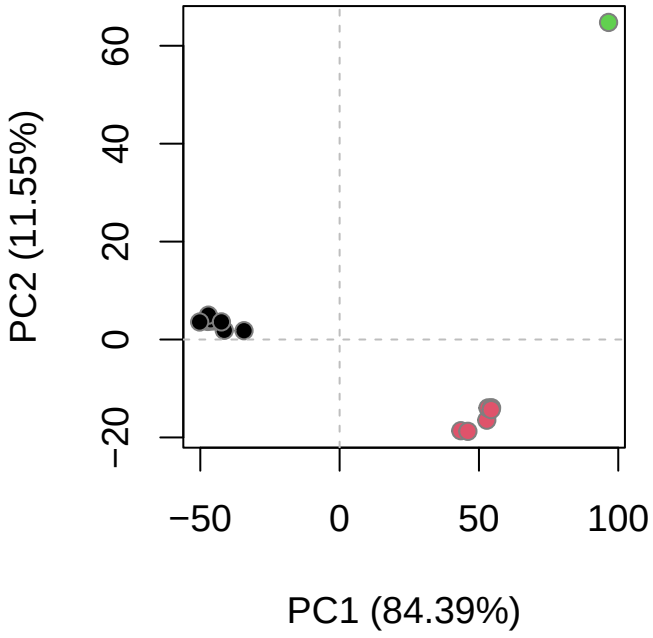
```
grps.rd <- cutree(hc.rd, k=3)
plot(hc.rd)
```



And now my PC plot colored by clustering group

```
grps.rd <- cutree(hc.rd, k=3)

plot(pc.xray, 1:2, col="grey50", bg=grps.rd, pch=21, cex=1)
```



To visualize the major structural variations in the ensemble the function `mktrj()` can be used to generate a trajectory PDB file by interpolating along a give PC (eigenvector):

```
# Visualize first principal component
mktrj(pc.xray, pc=1, file="pc_1.pdb")
```

We can now open this trajectory file in Molstar to view a wee movie of the major differences (i.e. displacement of atoms) in the structure set as we move along PC1.

```
#Plotting results with ggplot2
library(ggplot2)
library(ggrepel)

df <- data.frame(PC1=pc.xray$z[,1],
                 PC2=pc.xray$z[,2],
                 col=as.factor(grps.rd),
                 ids=ids)

p <- ggplot(df) +
  aes(PC1, PC2, col=col, label=ids) +
  geom_point(size=2) +
  geom_text_repel(max.overlaps = 20) +
```

```
  theme(legend.position = "none")
p
```
